## 1 Problem 4

### 1.1 Part A

“Show by reduction from the Halting Problem that there is no Turing machine that takes as input a Turing machine  $M$ , and determines whether the language  $L(M)$  accepted by  $M$  is the empty language.”

Assume there is a decider  $W$  for the problem described above. Also assume there is a Turing machine  $\text{Halting}$  that takes as input a Turing machine  $P$  and string  $I$ . This machine constructs a Turing machine  $W$  that takes input  $x$ . If  $x \neq I$ ,  $W$  rejects. If  $x = I$ ,  $W$  runs  $P$  on input  $I$ . If  $P$  accepts or rejects,  $W$  rejects.  $\text{Halting}$  then runs  $M$  on input  $W$ . If  $M$  accepts,  $\text{Halting}$  accepts. If  $M$  rejects,  $\text{Halting}$  rejects.

$P$  halts on  $I$  iff  $M$  accepts no strings. Since  $\text{Halting}$  is undecidable, it is impossible for  $M$  to be a decider. Therefore, the problem above is undecidable.

### 1.2 Part B

“Show by reduction from the Halting Problem that there is no Turing machine that takes as input a Turing machine  $M$ , and determines whether the language  $L(M)$  accepted by  $M$  is the language of every string over the input alphabet.”

Assume there is a decider  $W$  for the problem described above. Also assume there is a Turing machine  $\text{Halting}$  that takes as input a Turing machine  $P$  and string  $I$ . This machine constructs a Turing machine  $W$  that takes input  $x$ .  $W$  runs  $P$  on  $I$ , then accepts.  $\text{Halting}$  then runs  $M$  on input  $W$ . If  $M$  accepts,  $\text{Halting}$  accepts. If  $M$  rejects,  $\text{Halting}$  rejects.

$P$  halts on  $I$  iff  $M$  accepts every string. Since  $\text{Halting}$  is undecidable, it is impossible for  $M$  to be a decider. Therefore, the problem above is undecidable.

### 1.3 Part C

“Show by reduction from the Halting Problem that there is no Turing machine that takes as input a Turing machine  $M$ , and deter-

mines whether the language  $L(M)$  accepted by  $M$  includes the string 11110.”

Assume there is a decider  $W$  for the problem described above. Also assume there is a Turing machine  $\text{Halting}$  that takes as input a Turing machine  $P$  and string  $I$ . This machine constructs a Turing machine  $W$  that takes input  $x$ .  $W$  runs  $P$  on  $I$ . If  $P$  accepts or rejects  $I$ ,  $W$  accepts if  $x=11110$ , otherwise it rejects.  $\text{Halting}$  then runs  $M$  on input  $W$ . If  $M$  accepts,  $\text{Halting}$  accepts. If  $M$  rejects,  $\text{Halting}$  rejects.

$P$  halts on  $I$  iff  $M$  accepts every string. Since  $\text{Halting}$  is undecidable, it is impossible for  $M$  to be a decider. Therefore, the problem above is undecidable.

## 1.4 Part D

”Let  $P$  be some property of languages. Further assume there is a Turing machine  $M_1$  that accepts a language  $L_1$  that has property  $P$ , and a Turing machine  $M_2$  that accepts a language  $L_2$  that does not have property  $P$ . Show by reduction from the Halting Problem that there is no Turing machine that takes as input a Turing machine  $M$ , and determines whether the language  $L(M)$  accepted by  $M$  satisfies property  $P$ .”

Assume there is a decider  $W$  for the problem described above. Also assume there is a Turing machine  $\text{Halting}$  that takes as input a Turing machine  $T$  and string  $I$ . This machine constructs a Turing machine  $W$  that takes input  $x$ .  $W$  runs  $T$  on  $I$ . If  $T$  accepts or rejects  $I$ ,  $W$  accepts if the property  $P$  is satisfied, otherwise it rejects.  $\text{Halting}$  then runs  $M_1$  on input  $W$ . If  $M_1$  accepts,  $\text{Halting}$  accepts. If  $M_1$  rejects,  $\text{Halting}$  rejects.

$T$  halts on  $I$  iff  $M$  satisfies the property  $P$ . Since  $\text{Halting}$  is undecidable, it is impossible for  $M$  to be a decider. Therefore, the problem above is undecidable.

## 1.5 Part E

”Explain why the first three subproblems are consequences of the fourth subproblem.”

Part D is a generic form of parts A-C. Each problem is defined by its individual property.
